

MIRROR DEMISTER

INSTALLATION INSTRUCTION

- The heating element is double insulated, eliminating the need for an earth connection.
- The optimum temperature is 36°C; therefore a transformer or thermostat is not required.

1. MD350 Mirror Demister, 350mm x 350mm (30W)
2. MD500 Mirror Demister, 430mm x 500mm (40W)
3. MD600 Mirror Demister, 550mm x 600mm (60W)
4. MD800 Mirror Demister, 550mm x 800mm (80W)

1. The Demister must be installed by a Registered Electrician in accordance with local Electrical Compliance regulations.
2. The Demister can be glued to the back wall using the double sided tape on the same side as the termination box, or directly to the back of the mirror using the peel and stick backing on the opposite side of the termination box, but you must allow for the termination box to be recessed flat into the back wall so it does not protrude.
3. Where the Demister will not stick, you can staple or tape around the edges, but no closer than 20mm from the heating element.

4. Position the Demister so the termination box is closest to the power feed.
5. Take a power feed from a light circuit or separate electrical circuit, exiting the wall, typically at the bottom of where the mirror is mounted.
6. Place the Demister in position. Ensure it is completely flat once all the backing has been removed.
7. Line up the power feed with the Demister power cable and connect so the connection does not protrude from the wall.
8. Allow a 2mm air gap between the wall and mirror. If you have a metal periphery, ensure the mirror is earthed according to local regulations.
9. The mirror can be screwed, glued or mounted in a frame.
10. DO NOT CUT, PUNCTURE, STAPLE through the "heating element". If damaged, do not repair, but send back to the Supplier.
11. DO NOT pull forcefully on the Demister power cable as this may cause damage.
